Design Features

- ◆ Dedicated Single Chip Solution for Mobile Power
- ◆ Programmable up to 5V/2.1A Input Current
- ◆ Programmable up to 5V/1.5A Output Current
- ◆ Programmable up to 1.5A Switching Charge Current
- ◆ Programmable 4.1V to 4.35V Battery Voltage
- ◆ Prioritized Power Path from Input to Output
- ◆ 2.2MHz/1.1MHz Switching Frequencies
- ◆ 4LEDs Battery Level and Status Indication
- ◆ <10μA Battery Low Battery Leakage Current
- ◆ No Load Shutdown and Push Button Turn-on
- ◆ Battery Impedance Compensation
- ◆ Battery Over Current, Over Voltage, Over Temperature and Short Circuit Protections
- ◆ Charge Current Foldback at 110°C Die Temperature
- ◆ IC Over Temperature Protection

Operation and Application

ACT2801 is a space-saving and high-performance low-profile single-chip solution for backup battery pack and standalone battery charger. ACT2801 integrates all the functions that backup battery packs need, including switching charger, Boost converter and LED indication.

ACT2801 operates at 2.2MHz/1.1MHz for switching charger and 1.1MHz/0.55MHz for Boost converter allowing tiny external inductor and capacitors. ACT2801 provides a direct power path from input to output with programmable current limit while providing power to switching charger. Output has higher priority than battery charger if the programmed input current limit is reached.

ACT2801 charges battery with full cycle of preconditioning, fast charge with constant current and constant voltage until end of charge. The battery charger is thermally regulated at 110°C with charge current foldback.

ACT2801 Boost converter steps battery voltage up to 5V. Boost converter features high efficiency, constant current regulation, short circuit protection and over voltage protection.

ACT2801 provides 3.5mA constant currents to drive 4 LEDs to indicate battery level and charging status. Battery impedance is compensated at battery level indication.

PC Board Layout Guidance

1) Arrange the power components to reduce the AC loop size that consists of C2, V_{OUT}, SW and PGND. C2 (1206 size) must be placed close to the IC and across the V_{OUT} and PGND traces and SW trace goes under the C2 .

- 2) Use copper plane for PGND for best heat dissipation and noise immunity. AGND and PGND are connected under the IC thermal pad with 4x4 vias matrix.
- 3) SW copper area should be limited due to EMI consideration.
- 4) Use Kevin sense from sense resistor R2 to CSP and CSN pins as shown in the layout figure.
- 5) A separate trace is from V_{BAT} input to BAT pin for battery voltage sense accuracy.
- 6) RC snubber is recommended to add across SW to PGND to reduce EMI noise.
- 7) A 10V/1A schottky is added from inductor terminal to V_{OUT} to reduce EMI noise.

W=14.5mm
H=12.8mm

ACT4501 provides constant current (CC) output with patented Active-CC control technology that eliminates external sense resistors and the related efficiency loss.

The ACT4501 operates at constant output voltage mode until it reaches the CC limit set by the ISET resistor. The devices are available in a SOP-8 package.

Design Features

- ◆ Wide input voltage range from 10V to 30V
- ◆ Transparent input voltage surge 12V-40V-12V
- ◆ 0.5A-1.25A output current limit
- ◆ 4.75V-5.25V during input and load transients
- ◆ 5% output voltage accuracy
- ◆ 125kHz switching frequency
- ◆ 88% efficiency at 12V input
- ◆ Least external components
- ◆ Low-cost single layer PCB with very good EMC performance

Operation and Application

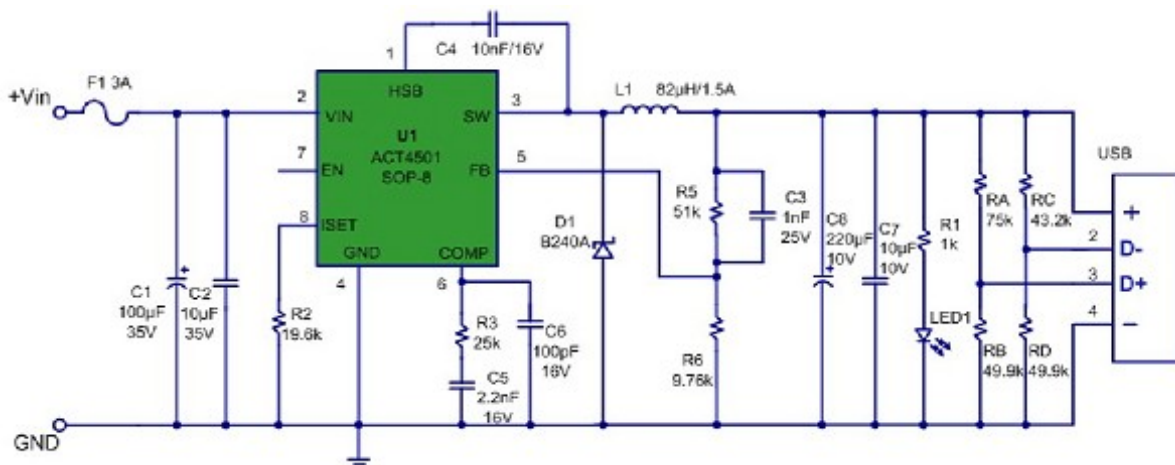

ACT4501 is a step-down DC-DC converter with wide input voltage range and high efficiency dedicated to 5V/1A smart phone micro car chargers. The ACT4501 is internally optimized for good EMC performance and it passed radiated EMI test even on low-cost single layer PCBs without adding any EMC components.

Key Component Selection

Higher output inductance reduces the inductor peak-to-peak current at the expense of higher larger core size and inductance DCR value. Usually, an optimum inductance value is selected to make its peak-to-peak current 20%-40% of the maximum load current. The Schottky diode must have current rating higher than the maximum output current and the reverse voltage rating higher than the maximum input voltage. Output capacitor is selected to keep the peak-to-peak voltage ripple under required value and also meet the load transient requirements. Usually, the combination of low ESR capacitors and tantalum or electrolytic types are used. In this application, 220uF electrolytic capacitor is connected in parallel with a small 2.2uF ceramic capacitor to achieve small output voltage ripple and meet the requirements of input and load dynamic response.

PC Board Layout Guidance

- 1) Arrange the power components to reduce the AC loop size that consists of CIN, IN pin, SW pin in the Schottky diode.
- 2) Place input decoupling ceramic capacitor CIN as close to IN pin as possible. CIN is connected power GND with vias or short and wide path.

- 3) Place feedback resistor close to FB pin.
- 4) Use short trace connecting HSB-C4-SW loop.
- 5) SW pad is a noisy node switching from Vin to GND. It should be isolated away from the rest of circuit for good EMI and low noise operation.

Typical performance characteristics

L=39.8mm
W=14.9mm
H=12.6mm

Design Features

- ◆ Wide input voltage range from 10V to 38V
- ◆ Transparent input voltage surge 12V-40V-12V
- ◆ 4.75V-5.25V during input and load transients
- ◆ 5% output voltage accuracy
- ◆ 225kHz switching frequency
- ◆ Standby input current 3.0mA
- ◆ 2.35 accurate current limit
- ◆ Shut down at output short circuit
- ◆ Thermal shutdown protection
- ◆ Output cord compensation
- ◆ Over current protection
- ◆ Meet the EN55022 EMC standard

Operation and Application

ACT4523 is a wide input voltage, high efficiency Active CC step-down DC-DC converter that operates in either CV (Constant Output Voltage) mode or CC (Constant Output Current) mode. ACT4523 provides up to 3.0A output current at 225kHz switching frequency. Active CC is a patent-pending control scheme to

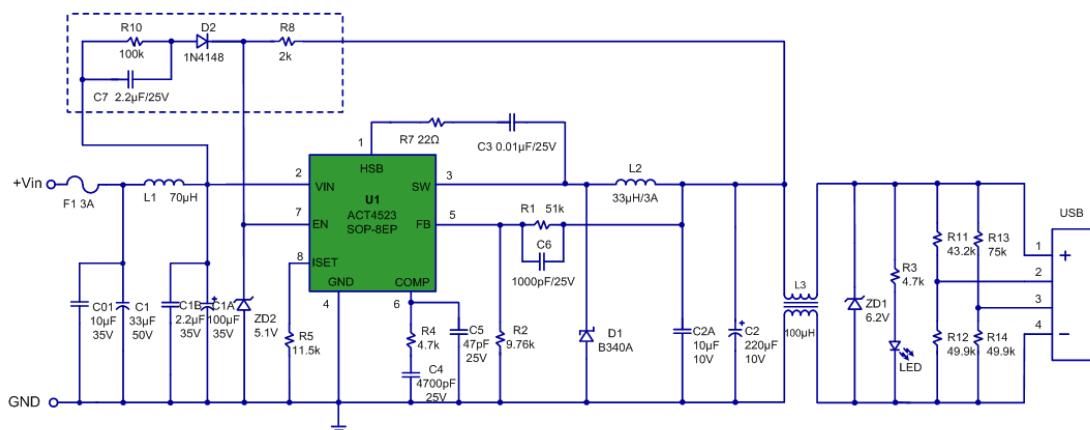

provide CC function accuracy by senseless constant current control, which eliminates the expensive, high accuracy current sense resistor, making it ideal for battery charging applications. The ACT4523 operates at constant output voltage mode until it reaches the CC limit set by the ISET resistor. The devices are available in a SOP8-EP package.

Key Component Selection

Higher output inductance reduces the inductor peak-to-peak current at the expense of higher larger core size and inductance DCR value. Usually, an optimum inductance value is selected to make its peak-to-peak current 20%-40% of the maximum load current. The Schottky diode must have current rating higher than the maximum output current and the reverse voltage rating higher than the maximum input voltage. Output capacitor is selected to keep the peak-to-peak voltage ripple under required value and also meet the load transient requirements. For this application, 22uF ceramic capacitors are needed. In the case of tantalum or electrolytic types, 220uF capacitor is connected in parallel with a small 1uF-10uF ceramic capacitor to achieve small output voltage ripple and meet the requirements of input and load dynamic response.

PC Board Layout Guidance

- 1) Arrange the power components to reduce the AC loop size that consists of CIN, IN pin, SW pin the Schottky diode.
- 2) Place input decoupling ceramic capacitor CIN as close to IN pin as possible. CIN is connected power GND with vias or short and wide path.
- 3) Use copper plane for power GND for best heat dissipation and noise immunity.
- 4) Place feedback resistor close to FB pin.
- 5) Use short trace connecting HSB-C3-R7-SW loop. Thermal pad is connected to a large ground copper area.
- 6) SW pad is a noisy node switching from Vin to GND. It should be isolated away from the rest of circuit for good EMI and low noise operation.

 W=16.2mm
 H=14.6mm

Design Features

- ◆ Wide input voltage range from 10V to 36V
- ◆ Transparent input voltage surge 12V-40V-12V
- ◆ 4.75V-5.25V during input and load transients
- ◆ 5% output voltage accuracy
- ◆ 250kHz switching frequency
- ◆ Standby input current 5mA
- ◆ 2.4-2.9A accurate current limit
- ◆ Thermal shutdown protection
- ◆ Output cord compensation
- ◆ Over current protection
- ◆ Output over voltage protection

Operation and Application

ACT4523A is a wide input voltage, high efficiency Active CC step-down DC/DC converter that operates in either CV (Constant Output Voltage) mode or CC (Constant Output Current) mode. ACT4523A provides up to 3.5A output current at 250kHz switching frequency. Active CC is a

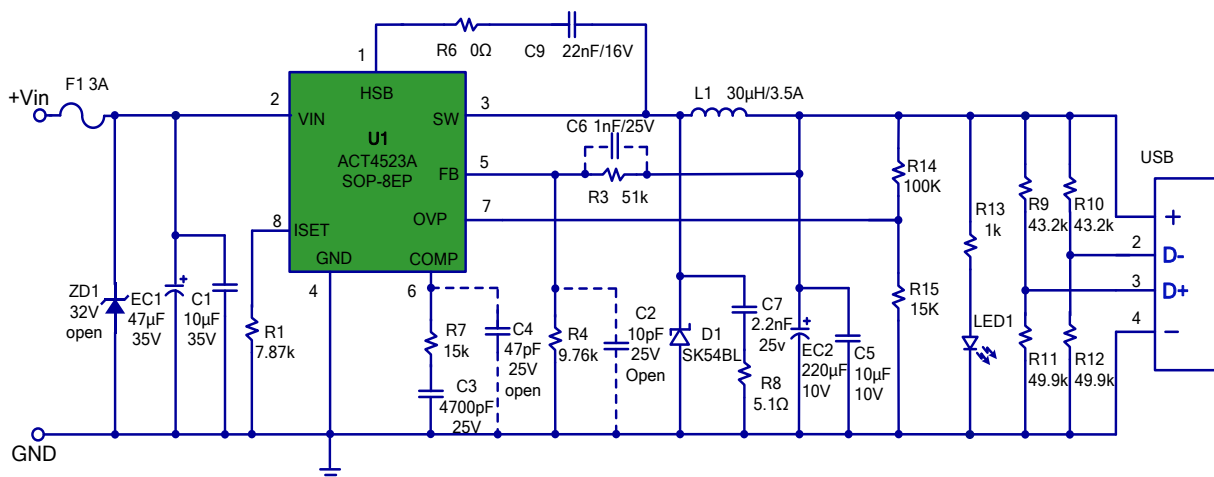

patent-pending control scheme to provide CC function accuracy by senseless constant current control, which eliminates the expensive, high accuracy current sense resistor, making it ideal for battery charging applications. charging applications. The ACT4523A operates at constant output voltage mode until it reaches the CC limit set by the ISET resistor. The devices are available in a SOP8-EP package.

Key Component Selection

Higher output inductance reduces the inductor peak-to-peak current at the expense of higher larger core size and inductance DCR value. Usually, an optimum inductance value is selected to make its peak-to-peak current 20%-40% of the maximum load current. The Schottky diode must have current rating higher than the maximum output current and the reverse voltage rating higher than the maximum input voltage. Output capacitor is selected to keep the peak-to-peak voltage ripple under required value and also meet the load transient requirements. For this application, 22uFx2 ceramic capacitors are needed. In the case of tantalum or electrolytic types, 220uF capacitor is connected in parallel with a small 1uF-10uF ceramic capacitor to achieve small output voltage ripple and meet the requirements of input and load dynamic response.

PC Board Layout Guidance

- 1) Arrange the power components to reduce the AC loop size that consists of CIN, IN pin, SW pin the Schottky diode.
- 2) Place input decoupling ceramic capacitor CIN as close to IN pin as possible. CIN is connected power GND with vias or short and wide path.
- 3) Use copper plane for power GND for best heat dissipation and noise immunity.
- 4) Place feedback resistor close to FB pin.
- 5) Use short trace connecting HSB-R5-C8-SW loop.
- 6) SW pad is a noisy node switching from Vin to GND. It should be isolated away from the rest of circuit for good EMI and low noise operation.
- 7) Thermal pad is connected to GND layer through at least 6 vias.

Design Features

- ◆ Wide input voltage range from 7.5V to 36V
- ◆ Transparent input voltage surge 12V-40V-12V
- ◆ 4.75V-5.25V during input and load transients
- ◆ 5% output voltage accuracy
- ◆ 200kHz switching frequency
- ◆ Standby input current 10mA
- ◆ Programmable precise output current limit via sensing resistors
- ◆ 3ms internal soft start up time
- ◆ Cycle-by-cycle over current protection
- ◆ Thermal shutdown protection
- ◆ Output cord compensation
- ◆ Nearly zero power loss at over loading or output short
- ◆ Hiccup mode at output over voltage
- ◆ Auto recovery into full load after faults
- ◆ Meet EN5502 EMC Standard

Key Component Selection

Higher output inductance reduces the inductor peak-to-peak current at the expense of higher larger core size and inductance DCR value. Usually, an optimum inductance value is selected to make its peak-to-peak current 20%-40% of the maximum load current. The Schottky diode must have current rating higher than the maximum output current and the reverse voltage rating.

Higher than the maximum input voltage. Double schottky diodes could be added to achieve higher efficiency and pass single fault test. Output capacitor is selected to keep the peak-to-peak voltage ripple under required value and also meet the load transient requirements. In the case of tantalum or electrolytic types, 680uF capacitor is connected in parallel with a small 1μF-10uF ceramic capacitor to achieve small output voltage ripple and meet the requirements of input and load dynamic response.

Design Features

- ◆ 95% Efficiency
- ◆ 4.8V to 30V Input and up to 1.5A Output
- ◆ 1.4 MHz Switching & Small SOT23-6 Package
- ◆ PWM (0-100%, 0.1-10kHz) Dimming
- ◆ **Thermal Shutdown & Short Circuit Protection**

Operation and Application

The bridge rectifier is for AC input only. The DC input is directly connected to IN and ground. The ACT111A has an under-voltage lockout (UVLO) at 4.0V with 250mV hysteresis. When input voltage falls below 4.0V, SW stops switching. The device is activated as input voltage goes higher than 4.2V.

The LED output current is sensed by a resistor in series with the LED. The ACT111A precisely regulates the LED current by the internal EA and 0.1V reference. The average LED current is determined by the equation: $I_{LED} = 0.1V/R_{SENSE}$.

The ACT111A allows dimming with a PWM signal at the DIM pin. A signal level above 1.5V enables switching and turns LED on. To turn off the LED current, the signal level has to be below 1.52V. The dimming signal frequency range is from 100Hz to 10kHz. A 200kΩ resistor is needed to connect between FB pin and R_{SENSE}. A 100pF capacitor is recommended to connect from the FB pin to ground.

Key Component Selection

An inductor with RMS rating greater than load current and its saturation current at least 30% higher should be used. Inductance value is selected to make its ripple current 20-30% of the load current. A Schottky diode (D5) is usually used for better efficiency as long as the breakdown voltage can withstand the maximum output voltage. The forward current rating of the diode must be at least equal to the maximum LED current.

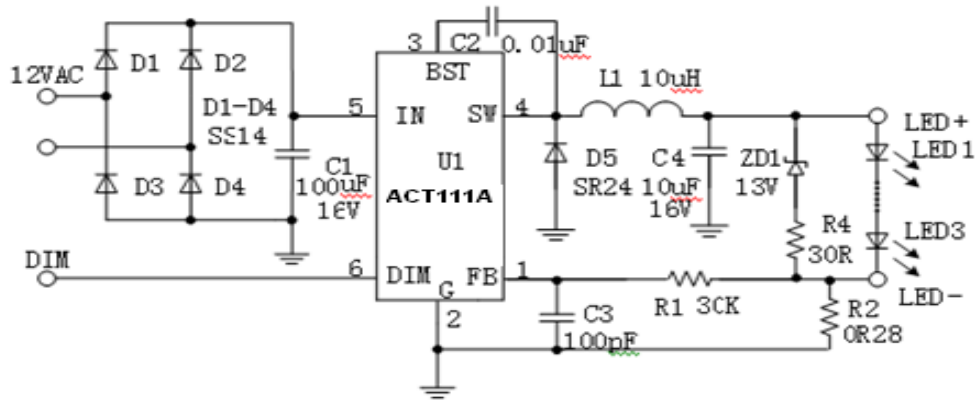

For AC input, if a conventional step-down line transformer is used, a low cost IN4001 can be used for D1-D4. However, if a high frequency electronic transformer is used, a Schottky diode such as SS14 should be used for high efficiency operation. For input and output capacitors, small size and low ESR ceramic capacitor is preferred.

PC Board Layout Guidance

Place input capacitor (C1) to IN pin, inductor (L1) and diode (D5) to SW pin as close as possible to reduce the voltage ringing at these pins. Place the current sense resistor (R2) close to FB pin. Minimize ground noise by connecting high current ground returns, the input capacitor ground lead, and the output filter ground lead to a single point (star ground configuration). There are two power loops in normal operation, one is formed when the SW is high and the high current flows through input capacitor (C1), internal MOSFET, inductor(L1), LEDs, R_{SENSE}(R2) to ground. The other loop is through inductor (L1), LEDs, R_{SENSE}(R2), ground to diode(D5). Make these loop areas as small as possible to minimize noise interaction.

ACT334 5V/1A Universal Charger For DOE Standard

Input Voltage	Device	Average Efficiency	Standby Power	Output Voltage	Output Power	Topology
90-264VAC	ACT334	75.60%	39mW	5V	5W	PSR flyback

Description

ACT334 is a 5 star high performance PSR CV/CC controller to achieve <30mW standby power. The unique fast startup architecture, 80kHz maximum switching frequency and driving external NPN make ACT334 the most cost effective 5 star solutions for small size cell phone charger.

Mini size

W*L*H=25.5mm*46.5mm*16mm

Key Features

- ◆ Patented Primary Side Regulation Technology
- ◆ Lowest total cost solution for cell phone charger using PWM IC
- ◆ Universal input voltage range from 85 to 264 VAC
- ◆ Accurate CV (5%) and CC (10%) performance
- ◆ Adjustable up to 80kHz Switching Frequency
- ◆ Integrated Output Cord Compensation
- ◆ CV & CC correction for Input line, output DC cord and transformer inductance variation
- ◆ No-load standby power < 0.05W
- ◆ Exceed the latest DOE average efficiency requirement
- ◆ No Y capacitor for EMI filter
- ◆ Short circuit and over-voltage protection
- ◆ Tiny SOT23-6 package.

Input Voltage	Device	Vo	Po	Transformer Core	Standby Power	Efficiency	Topology
90-264VAC	ACT411	12V	12W	EE16	90mW	82%	QR flyback

Description

ACT411 is a high performance peak current mode PWM controller which applies ActivePSR™ and ActiveQR™ technology. By applying frequency fold back and ActiveQR™ technology, ACT411 exceeds the latest ES2.0 efficiency standard. With Quasi-Resonant operation mode ACT411 can effectively improve efficiency, reduce the EMI noise and further reduce the components in input filter.

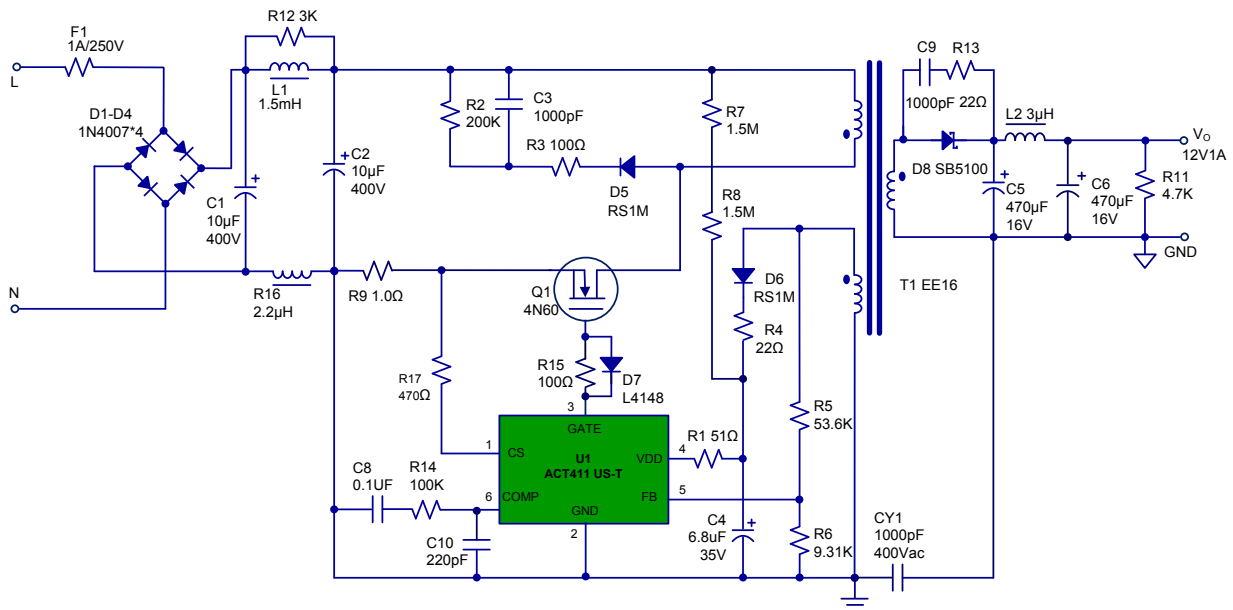

Mini size

W*L*H=30mm*52mm*16mm

Key Features

- ◆ Advanced Quasi-Resonant mode operation.
- ◆ Advanced burst mode operation enables low standby power of 90mW .
- ◆ Frequency jittering and Quasi-Resonant technology to decrease EMI.
- ◆ Patented frequency foldback and *ActiveQR™* technology increases the average system efficiency and exceeds the latest ES2.0 efficiency standard with good margin.
- ◆ Integrated patented line and inductance compensation, provide accurate CC
- ◆ Integrate comprehensive protection. In case of over temperature, over/under voltage, short winding, short current sense resistor, open loop and overload protection.
- ◆ Tiny SOT23-6 package.

Low Cost ACT413 5V/2.4A Universal Adapter

Input Voltage	Device	Vo	Po	Transformer Core	Standby Power	Efficiency	Topology
90-264VAC	ACT413	5V	12W	EPC17	80mW	78.44%	QR flyback

Description

ACT413 is a high performance QR mode PWM controller. 6-pin tiny package, low standby power and extensive protection features, upto 75kHz full load switching frequency make ACT413 the most attractive performance/cost adaptor solutions.

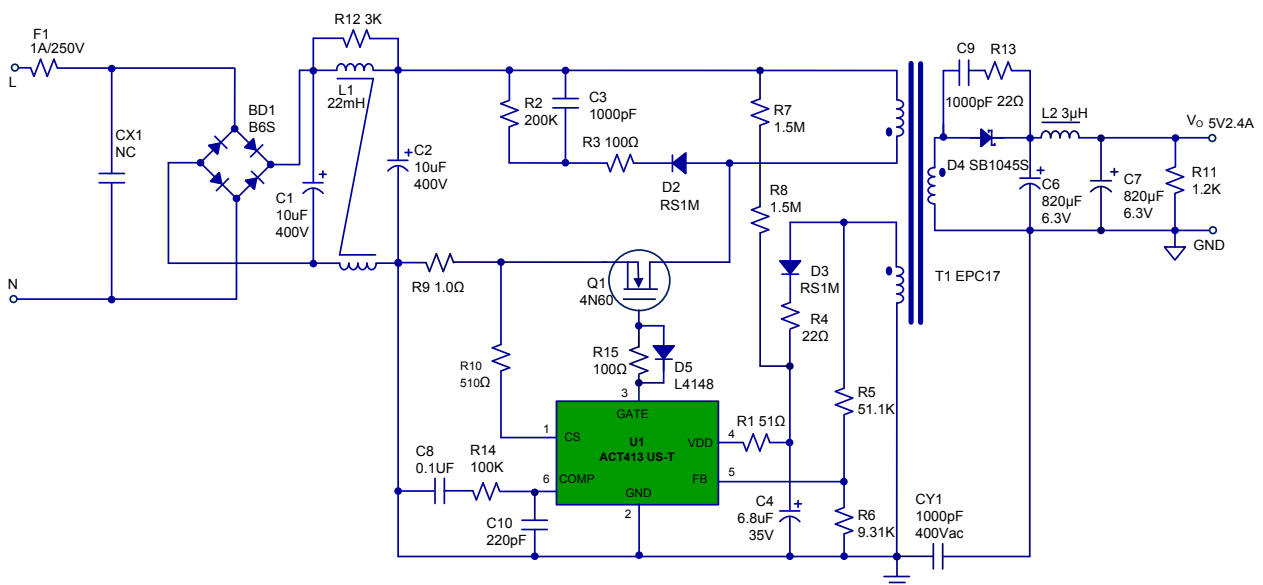

Normal size

W*L*H=33mm*52mm*16mm

Key Features

- ◆ Advanced Quasi-Resonant mode operation.
- ◆ Advanced burst mode operation enables low standby power of 80mW .
- ◆ Frequency jittering and Quasi-Resonant technology to decrease EMI.
- ◆ Patented frequency foldback and *ActiveQR™* technology increases the average system efficiency and exceeds the latest ES2.0 efficiency standard with good margin.
- ◆ Integrated patented line and inductance compensation, provide accurate CC
- ◆ Integrate comprehensive protection. In case of over temperature, over/under voltage, short winding, short current sense resistor, open loop and overload protection.
- ◆ Tiny SOT23-6 package.

ACT510 5V/2A Universal Adaptor

Input Voltage	Device	Standby Power	Output Voltage	Output Power	Topology
90-264VAC	ACT510	<100mW	5V	10W	QR flyback

Description

ACT510 is a high performance QR mode PWM controller. Very low standby power, extensive protection features, up to 125kHz full load switching frequency and excellent load transient response make ACT510 the very attractive solutions for small size, high performance chargers.

Normal size

W*L*H=29mm*53.5mm*20.5mm

Key Features

- ◆ Optimized advanced Quasi-Resonant operation.
- ◆ Advanced burst mode operation enables low standby power of 100mW and can lower than 50mW with external circuit.
- ◆ Frequency jetting and Quasi-Resonant technology to decrease EMI.
- ◆ Patented frequency foldback and *ActiveQR™* technology increases the average system efficiency compared to conventional solutions and exceeds the latest ES2.0 efficiency standard with good margin.
- ◆ Integrated patented line and inductance compensation, provide high accurate OCP/OLP protection.
- ◆ Built-in Soft-Start and Fast-Start circuit to decrease main external Mosfet stress, output voltage rise time and output voltage overshoot.
- ◆ Integrate comprehensive protection. In case of over temperature, over/under voltage, short winding, short current sense resistor, open loop and overload protection.
- ◆ Tiny SOT23-6 package.

ACT512_12V1A_DOE_Rev1.0

ACT513 12V/2A Universal Adaptor For DOE Standard

Input Voltage	Device	Average Efficiency	Standby Power	Output Voltage	Output Power	Topology
90-264VAC	ACT513	88.22%	94mW	12V	24W	CCM & QR flyback

Description

ACT513 is a high performance QR/CCM mode PWM controller. Low standby power and extensive protection features, up to 75kHz full load switching frequency and excellent load transient response make ACT513 the most attractive for general purpose adaptor solutions.

Normal size

W*L*H=44mm*92mm*29mm

Key Features

- Optimized CCM and advanced Quasi-Resonant operation.
- Advanced burst mode operation enables low standby power of 100mW and can lower than 50mW with external circuit.
- Frequency jetting and Quasi-Resonant technology to decrease EMI.
- Patented frequency foldback and *ActiveQR*[™] technology increases the average system efficiency compared to conventional solutions and exceeds the latest DOE efficiency standard with good margin.
- Integrated patented line compensation, provide accurate OCP/OLP protection.
- Built-in Soft-Start and Fast-Start circuit to decrease main external mosfet stress, output voltage rise time and output voltage overshoot.
- Integrate comprehensive protection. In case of over temperature, over/under voltage, short winding, short current sense resistor, open loop and overload protection.
- Tiny SOT23-6 package.

ACT8931A

IC Features

- ◆ Complete System Power Management for Portable Applications
 - ◆ *ActivePath™* Li+ Charger and System Power Selection
 - ◆ Three High-Efficiency Step-Down DC/DC Converters
 - ◆ 1.1A, 1.1A, and 1.2A
 - ◆ Four 320mA Low Noise, High PSRR LDOs
- ◆ Dynamic Voltage Scaling (DVS) Support
- ◆ 5mm × 5mm, Thin-QFN (TQFN55-40) Package

Application Circuit

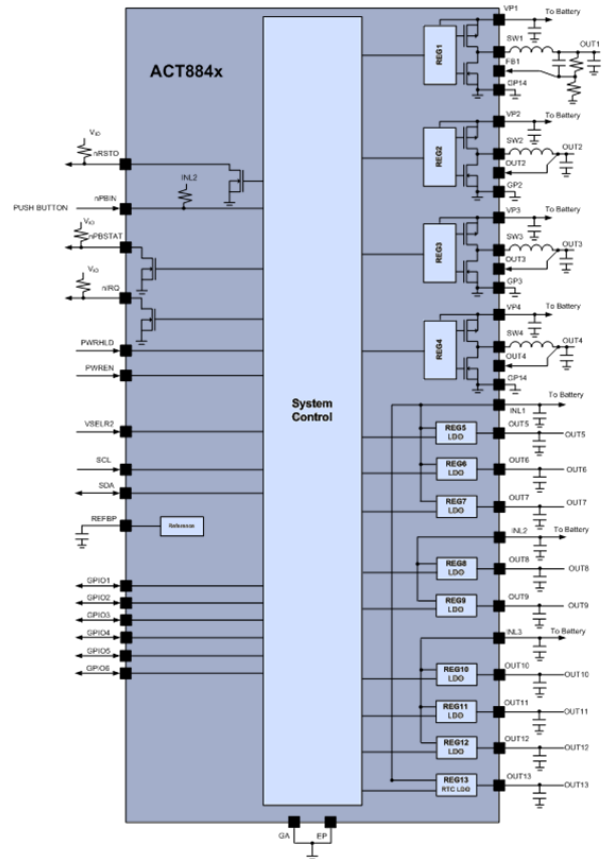

ACT8846/ACT8847/ACT8849

IC Features

- ◆ Integrated Power Supply
 - ◆ Four Step-Down DC/DC Converters
 - ◆ 2.8A, 2.8A, 1.5A, 1.5A.
 - ◆ Eight Low Noise, High PSRR LDOs
 - ◆ 3 × 150mA, 5 × 320mA.
 - ◆ One Low IQ Always-on LDOs
 - ◆ Backup Battery Charger.
- ◆ System Control and Interface
 - ◆ Four General Purpose I/O with PWM drivers
 - ◆ I²C™ Serial Interface
 - ◆ Interrupt Controller
- ◆ System Management
 - ◆ Reset Interface and Sequencing Controller
 - ◆ Watchdog Supervision
 - ◆ Multiple Sleep Mode
 - ◆ Thermal Management Subsystem
- ◆ Dynamic Voltage Scaling (DVS) Support
- ◆ 6mm x 6mm, TQFN66-48 Package

Application Circuit

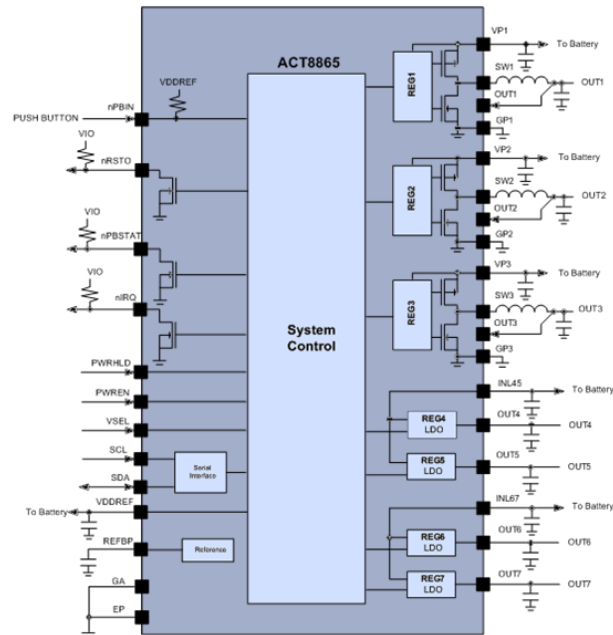

ACT8865

IC Features

- ◆ Features
 - ◆ Three Step-Down DC/DC Converters
 - ◆ Four Low –Dropout Linear Regulators
 - ◆ Minimal External Components
 - ◆ Tiny 4x4mm TQFN44-32 Package
 - ◆ 0.75mm Package Height
- ◆ Power manager
 - ◆ I²C™ Serial Interface for PMIC control
 - ◆ Integrated Enable/Disable Sequencing
 - ◆ Push Button for Power-Up/ Power-Down and Reset.
 - ◆ System Voltage Monitor with programmable threshold
 - ◆ Power Fail detector on each output channel
 - ◆ Interrupt Output for Power Fail Conditions
 - ◆ Interrupt Output line for Power fail conditions

Application Circuit

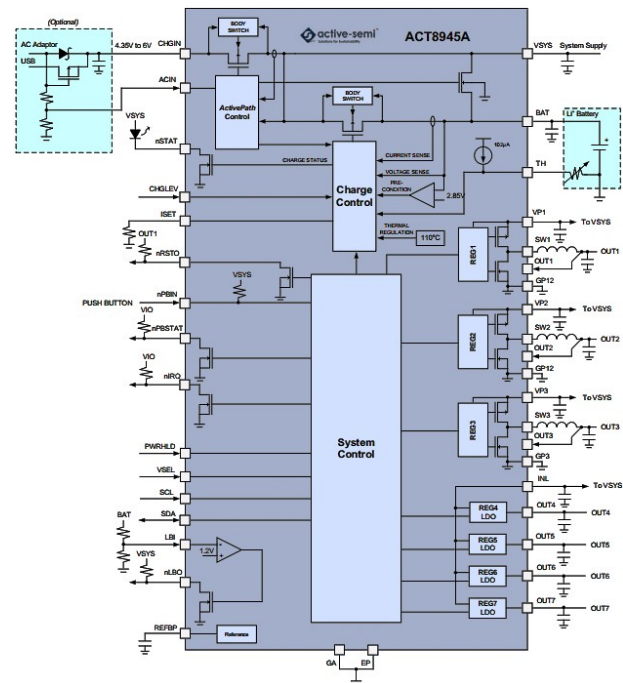

ACT8945A

IC Features

- ◆ Features
 - ◆ Three Step-Down DC/DC Converters
 - ◆ Four Low-Dropout Linear Regulators
 - ◆ Integrated ActivePath™ Charger
 - ◆ Advanced Power Source Management
 - ◆ Input Protection up to 12V
 - ◆ Tiny 5x5mmTQFN55-40 Package
 - ◆ Minimal External Components
- ◆ Power manager
 - ◆ I²C™ Serial Interface for PMIC control
 - ◆ Integrated Enable/Disable Sequencing
 - ◆ Push Button for Power-Up/ Power-Down and Reset.
 - ◆ System Voltage Monitor with programmable threshold
 - ◆ Power Fail detector on each output channel
 - ◆ Interrupt Output for Power Fail Conditions

Application Circuit

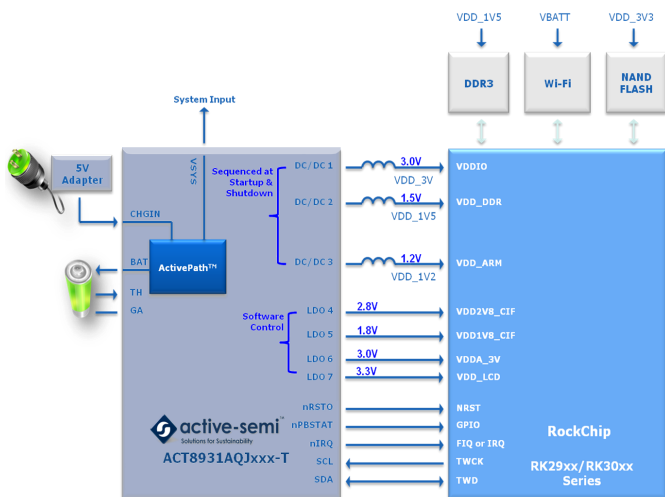

Highly Intergrated Power Management Solutions

Rockchip RK2918/RK2926/RK2928/RK3026/RK3028 Solution

Description

The ACT8931A is an advanced *ActivePMU*[™] that was developed specifically for powering applications using high-performance processors, such as the Rockchip RK2918, RK2926, RK2928, RK3026 and RK3028. This device supplies all major power rails and interface signals required by the RK2918, RK2926, RK2928, RK3026 and RK3028 as well as an *ActivePath*[™] charger, and a variety of features that greatly simplify the power management system design.

Application Diagram

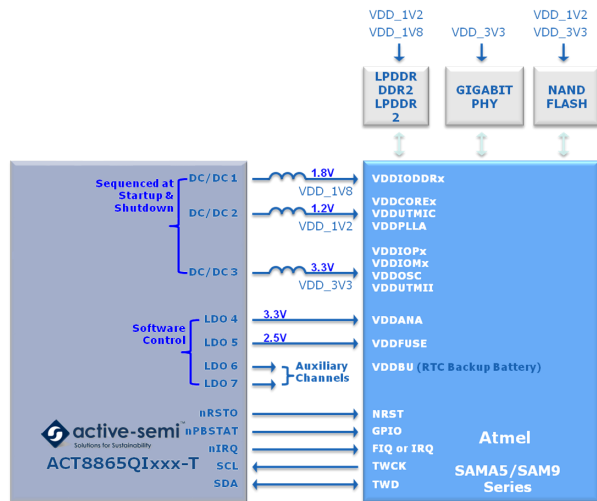

Atmel SAM5A5 Cotex-A5 and SAM9 Solution

Description

The ACT8865 is a complete, cost effective, highly-efficient *ActivePMU*[™] power management solution, optimized for the unique power, voltage-sequencing, and control requirements of the Atmel SAMA5D3 series: SAMA5D[31/33/34/35/36] and SAM9 series: SAM9G[15/25/35/45/46], SAM9X[25/35], SAM9M[10/11], SAM9N[11/12] processors. It is ideal for a wide range of high performance portable handheld applications such as human-machine interfaces, control panels, smart grid infrastructures, network gateways, M2M systems, 2D barcode scanners, barcode printers, machine vision equipment, as well as home and commercial building automations, POS terminals, medical devices and white goods.
