## 250MHz Differential Twisted-Pair Drivers

## EL5171, EL5371

The EL5171 and EL5371 are single and triple bandwidth amplifiers with an output in differential form. They are primarily targeted for applications such as driving twisted-pair lines in component video applications. The input signal is single-ended and the outputs are always differential.

On the EL5171 and EL5371, two feedback inputs provide the user with the ability to set the gain of each device (stable at minimum gain of one). For a fixed gain of two, please see EL5170 and EL5370.

The output common mode level for each channel is set by the associated $\mathrm{V}_{\text {REF }}$ pin, which have a -3dB bandwidth of over 50 MHz . Generally, these pins are grounded but can be tied to any voltage reference.

All outputs are short circuit protected to withstand temporary overload condition.

The EL5171 and EL5371 are specified for operation over the full $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range.

## Features

- Fully differential outputs and feedback
- Input range $\pm 2.3 \mathrm{~V}$ typ.
- 250MHz 3dB bandwidth
- 800V/ $\mu \mathrm{s}$ slew rate
- Low distortion at 5MHz
- Single 5 V or dual $\pm 5 \mathrm{~V}$ supplies
- 90 mA maximum output current
- Low power-8mA per channel
- Pb-free available (RoHS compliant)

## Applications

- Twisted-pair driver
- Differential line driver
- VGA over twisted-pair
- ADSL/HDSL driver
- Single-ended to differential amplification
- Transmission of analog signals in a noisy environment

## Pinouts

EL5171, EL5371
Pin Descriptions

| EL5171 | EL5371 | PIN NAME | PIN FUNCTION |
| :---: | :---: | :---: | :---: |
| 1 |  | FBP | Feedback from non-inverting output |
| 2 |  | IN+ | Non-inverting input |
| 3 |  | REF | Reference input, sets common-mode output voltage |
| 4 |  | FBN | Feedback from inverting output |
| 5 |  | OUT- | Inverting output |
| 6 |  | VS+ | Positive supply |
| 7 |  | VS- | Negative supply |
| 8 |  | OUT+ | Non-inverting output |
|  | 17, 21, 27 | FBP3, FBP2, FBP1 | Feedback from non-inverting output |
|  | 2, 6, 10 | INP1, INP2, INP3 | Non-inverting inputs |
|  | 4, 8, 12 | REF1, REF2, REF3 | Reference input, sets common-mode output voltage |
|  | 3, 7, 11 | INN1, INN2, INN3 | Inverting inputs, note that on EL5171, this pin is also the REF pin |
|  | 16, 20, 26 | FBN3, FBN2, FBN1 | Feedback from inverting output |
|  | 15, 19, 25 | OUT3B, OUT2B, OUT1B | Inverting outputs |
|  | 24 | VSP | Positive supply |
|  | 23 | VSN | Negative supply |
|  | 18, 22, 28 | OUT3, OUT2, OUT1 | Non-inverting outputs |
|  | 1, 5, 9, 13 | NC | No connects, grounded for best crosstalk performance |
|  | 14 | $\overline{\mathrm{EN}}$ | $\overline{\text { ENABLE }}$ |

NOTES:

1. Add "-T*" suffix for tape and reel. Please refer to TB347 for details on reel specifications.
2. These Intersil Pb -free plastic packaged products employ special Pb -free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb -free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for EL5171, EL5371. For more information on MSL please see tech brief TB363.

## Simplified Schematic

## Description of Operation and Application Information

## Product Description

The EL5171 and EL5371 are wide bandwidth, low power and single-ended to differential output amplifiers. The EL5171 is a single channel differential amplifier. Since the $I_{N^{-}}$pin and REF pin are tied together internally, the EL5171 can be used as a single-ended to differential converter. The EL5371 is a triple channel differential amplifier. The EL5371 has a separate $I_{N^{-}}$ pin and REF pin for each channel. It can be used as a single/differential ended to differential converter. The EL5171 and EL5371 are internally compensated for closed loop gain of +1 or greater. Connected in gain of 1 and driving a $1 \mathrm{k} \Omega$ differential load, the EL5171 and EL5371 have a -3dB bandwidth of 250 MHz . Driving a $200 \Omega$ differential load at gain of 2 , the bandwidth is about 30 MHz . The EL5371 is available with a power-down feature to reduce the power while the amplifier is disabled.

## Input, Output, and Supply Voltage Range

The EL5171 and EL5371 have been designed to operate with a single supply voltage of 5 V to 10 V or split supplies with its total voltage from 5 V to 10 V . The amplifiers have an input common mode voltage range from -4.5 V to 3.4 V for $\pm 5 \mathrm{~V}$ supply. The differential mode input range (DMIR) between the two inputs is from -2.3 V to +2.3 V . The input voltage range at the REF pin is from -3.3 V to 3.8 V . If the input common mode or differential mode signal is outside the above-specified ranges, it will cause the output signal to become distorted.

The output of the EL5171 and EL5371 can swing from -3.9V to +3.9 V at $1 \mathrm{k} \Omega$ differential load at $\pm 5 \mathrm{~V}$ supply. As the load resistance becomes lower, the output swing is reduced.

## Differential and Common Mode Gain Settings

For EL5171, since the $I_{N^{-}}$pin and REF pin are bound together as the REF pin in an 8 Ld package, the signal at the REF pin is part of
the common mode signal and also part of the differential mode signal. For the true balance differential outputs, the REF pin must be tied to the same bias level as the $I_{N^{+}}$pin. For a $\pm 5 \mathrm{~V}$ supply, just tie the REF pin to GND if the $\mathrm{I}_{\mathrm{N}}+$ pin is biased at 0 V with a $50 \Omega$ or $75 \Omega$ termination resistor. For a single supply application, if the $\mathrm{l}_{\mathrm{N}^{+}}$is biased to half of the rail, the REF pin should be biased to half of the rail also.

The gain setting for EL5171 is expressed in Equation 1:
$v_{O D M}=V_{I N^{+}} \times\left(1+\frac{R_{F 1}+R_{F 2}}{R_{G}}\right)$
$V_{\text {OCM }}=V_{\text {REF }}=0 V$

$$
\text { ODM }=V_{I N^{+}} \times\left(1+\frac{2 R_{F}}{R_{G}}\right)
$$

Where:

- $\mathrm{V}_{\mathrm{REF}}=0 \mathrm{~V}$
- $\mathrm{R}_{\mathrm{F} 1}=\mathrm{R}_{\mathrm{F} 2}=\mathrm{R}_{\mathrm{F}}$

The EL5371 has a separate $I_{N^{-}}$pin and REF pin. It can be used as a single/differential ended to differential converter. The voltage applied at REF pin can set the output common mode voltage and the gain is one.

The gain setting for EL5371 is expressed in Equation 2:
$\mathrm{V}_{\text {OCM }}=\mathrm{V}_{\text {REF }}$
$\mathrm{V}_{\mathrm{ODM}}=\left(\mathrm{V}_{\mathrm{IN}^{+}}-\mathrm{V}_{\mathrm{IN}^{-}}\right) \times\left(1+\frac{\mathrm{R}_{\mathrm{F} 1}+\mathrm{R}_{\mathrm{F} 2}}{\mathrm{R}_{\mathrm{G}}}\right)$

$$
\text { ODM }=\left(V_{I_{N}}+-V_{I_{N}}\right) \times\left(1+\frac{2 R_{F}}{R_{G}}\right)
$$

Where:

- $\mathrm{R}_{\mathrm{F} 1}=\mathrm{R}_{\mathrm{F} 2}=\mathrm{R}_{\mathrm{F}}$

## Choice of Feedback Resistor and Gain Bandwidth Product

For applications that require a gain of +1 , no feedback resistor is required. Just short the OUT+ pin to the FBP pin and the OUTpin to the FBN pin. For gains greater than +1, the feedback resistor forms a pole with the parasitic capacitance at the inverting input. As this pole becomes smaller, the amplifier's phase margin is reduced. This causes ringing in the time domain and peaking in the frequency domain. Therefore, $\mathrm{R}_{\mathrm{F}}$ has some maximum value that should not be exceeded for optimum performance. If a large value of $R_{F}$ must be used, a small capacitor in the few Pico farad range in parallel with $R_{F}$ can help to reduce the ringing and peaking at the expense of reducing the bandwidth.

The bandwidth of the EL5171 and EL5371 depends on the load and the feedback network. $R_{F}$ and $R_{G}$ appear in parallel with the load for gains other than +1. As this combination gets smaller, the bandwidth falls off. Consequently, $\mathrm{R}_{\mathrm{F}}$ also has a minimum value that should not be exceeded for optimum bandwidth performance. For gain of $+1, R_{F}=0$ is optimum. For the gains other than +1, optimum response is obtained with $\mathrm{R}_{\mathrm{F}}$ between $500 \Omega$ to $1 \mathrm{k} \Omega$.

The EL5171 and EL5371 have a gain bandwidth product of 100 MHz for $R_{L D}=1 \mathrm{k} \Omega$. For gains $\geq 5$, their bandwidth can be predicted by Equation 3:
Gain $\times B W=100 \mathrm{MHz}$

## Driving Capacitive Loads and Cables

The EL5171 and EL5371 can drive 50pF differential capacitor in parallel with $1 \mathrm{k} \Omega$ differential load with less than 5 dB of peaking at gain of +1 . If less peaking is desired in applications, a small series resistor (usually between $5 \Omega$ to $50 \Omega$ ) can be
placed in series with each output to eliminate most peaking. However, this will reduce the gain slightly. If the gain setting is greater than 1 , the gain resistor $\mathrm{R}_{\mathrm{G}}$ can then be chosen to make up for any gain loss, which may be created by the additional series resistor at the output.

When used as a cable driver, double termination is always recommended for reflection-free performance. For those applications, a back-termination series resistor at the amplifier's output will isolate the amplifier from the cable and allow extensive capacitive drive. However, other applications may have high capacitive loads without a back-termination resistor. Again, a small series resistor at the output can help to reduce peaking.

## Disable/Power-Down (for EL5371 only)

The EL5371 can be disabled and its outputs placed in a high impedance state. The turn-off time is about $0.95 \mu \mathrm{~s}$ and the turn-on time is about 215ns. When disabled, the amplifier's supply current is reduced to $1.7 \mu \mathrm{~A}$ for $\mathrm{I}_{\mathrm{S}^{+}}$and $120 \mu \mathrm{~A}$ for $\mathrm{I}_{\mathrm{S}}$ typically, thereby effectively eliminating the power consumption. The amplifier's power-down can be controlled by standard CMOS signal levels at the ENABLE pin. The applied logic signal is relative to the $\mathrm{V}_{\mathrm{S}}+$ pin. Letting the $\overline{\mathrm{EN}}$ pin float or applying a signal that is less than 1.5 V below $\mathrm{V}_{\mathrm{S}^{+}}$will enable the amplifier. The amplifier will be disabled when the signal at the $\overline{\mathrm{EN}}$ pin is above $\mathrm{V}_{\mathrm{S}^{+}}-0.5 \mathrm{~V}$.

## Output Drive Capability

The EL5171 and EL5371 have internal short circuit protection. Its typical short circuit current is $\pm 90 \mathrm{~mA}$ for EL5171 and $\pm 70 \mathrm{~mA}$ for EL5371. If the output is shorted indefinitely, the power dissipation could easily increase such that the part will be destroyed. Maximum reliability is maintained if the output current never exceeds $\pm 60 \mathrm{~mA}$. This limit is set by the design of the internal metal interconnections.

## Power Dissipation

With the high output drive capability of the EL5171 and EL5371, it is possible to exceed the $+135^{\circ} \mathrm{C}$ absolute maximum junction temperature under certain load current conditions. Therefore, it is important to calculate the maximum junction temperature for the application to determine if the load conditions or package types need to be modified for the amplifier to remain in the safe operating area.

The maximum power dissipation allowed in a package is determined according to Equation 4:
$P D_{\text {MAX }}=\frac{T_{J M A X}-T_{\text {AMAX }}}{\Theta_{J A}}$
Where:

- $\mathrm{T}_{\text {JMAX }}=$ Maximum junction temperature
- $\mathrm{T}_{\text {AMAX }}=$ Maximum ambient temperature
- $\theta_{\mathrm{JA}}=$ Thermal resistance of the package

The maximum power dissipation actually produced by an IC is the total quiescent supply current times the total power supply

## EL5171, EL5371

voltage, plus the power in the IC due to the load, or as represented in Equation 5:

$$
\begin{equation*}
\mathrm{PD}=\mathrm{i} \times\left(\mathrm{V}_{\mathrm{STOT}} \times \mathrm{I}_{\mathrm{SMAX}}+\left(\mathrm{V}_{\mathrm{STOT}}-\Delta \mathrm{V}_{\mathrm{O}}\right) \times \frac{\Delta \mathrm{V}_{\mathrm{O}}}{\mathrm{R}_{\mathrm{LD}}}\right) \tag{EQ.5}
\end{equation*}
$$

Where:

$$
\begin{aligned}
& \mathrm{V}_{\mathrm{STOT}}=\text { Total supply voltage }=\mathrm{V}_{\mathrm{S}^{+}}-\mathrm{V}_{\mathrm{S}^{-}} \\
& \text {I }_{\text {SMAX }}=\text { Maximum quiescent supply current per channel } \\
& \Delta \mathrm{V}_{\mathrm{O}}=\text { Maximum differential output voltage of the application } \\
& \mathrm{R}_{\mathrm{LD}}=\text { Differential load resistance } \\
& \text { ILOAD } \text { = Load current } \\
& \mathrm{i}=\text { Number of channels }
\end{aligned}
$$

By setting the two $\mathrm{PD}_{\text {MAX }}$ equations equal to each other, we can solve the output current and $\mathrm{R}_{\text {LOAD }}$ to avoid the device overheat.

## Power Supply Bypassing and Printed Circuit Board Layout

As with any high frequency device, a good printed circuit board layout is necessary for optimum performance. Lead lengths should be as sort as possible. The power supply pin must be well
bypassed to reduce the risk of oscillation. For normal single supply operation, where the $\mathrm{V}_{\mathbf{S}^{-}}$pin is connected to the ground plane, a single $4.7 \mu \mathrm{~F}$ tantalum capacitor in parallel with a $0.1 \mu \mathrm{~F}$ ceramic capacitor from $\mathrm{V}_{\mathbf{S}^{+}}$to GND will suffice. This same capacitor combination should be placed at each supply pin to ground if split supplies are to be used. In this case, the $\mathrm{V}_{\mathbf{S}^{-}}$pin becomes the negative supply rail.

For good AC performance, parasitic capacitance should be kept to a minimum. Use of wire wound resistors should be avoided because of their additional series inductance. Use of sockets should also be avoided, if possible. Sockets add parasitic inductance and capacitance that can result in compromised performance. Minimizing parasitic capacitance at the amplifier's inverting input pin is very important. The feedback resistor should be placed very close to the inverting input pin. Strip line design techniques are recommended for the signal traces.

As the signal is transmitted through a cable, the high frequency signal will be attenuated. One way to compensate this loss is to boost the high frequency gain at the receiver side.

## Typical Applications

FIGURE 27. TWISTED PAIR CABLE RECEIVER

## EL5171, EL5371

DC Gain $=1+\frac{2 R_{F}}{R_{G}}$

$$
\mathrm{f}_{\mathrm{L}} \cong \frac{1}{2 \pi \mathrm{R}_{\mathrm{G}} \mathrm{C}_{\mathrm{C}}}
$$

(HF)Gain $=1+\frac{2 R_{F}}{R_{G} \| R_{G C}}$

$$
\mathrm{f}_{\mathrm{H}} \cong \frac{1}{2 \pi \mathrm{R}_{\mathrm{GC}} \mathrm{C}_{\mathrm{C}}}
$$

8 LEAD NARROW BODY SMALL OUTLINE PLASTIC PACKAGE Rev 0, 08/09

SIDE VIEW "A

$\underline{\underline{\text { TYPICAL RECOMMENDED LAND PATTERN }}}$

DETAIL "A"

NOTES:

1. Dimensions are in millimeters. Dimensions in ( ) for Reference Only.
2. Dimensioning and tolerancing conform to AMSE Y14.5m-1994.
3. Unless otherwise specified, tolerance : Decimal $\pm 0.05$
4. Dimension does not include interlead flash or protrusions. Interlead flash or protrusions shall not exceed 0.25 mm per side.
5. The pin \#1 identifier may be either a mold or mark feature.
6. Reference to JEDEC MS-012.

## Shrink Small Outline Plastic Packages (SSOP) Quarter Size Outline Plastic Packages (QSOP)

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15 mm ( 0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25 mm ( 0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. " $L$ " is the length of terminal for soldering to a substrate.
7. " N " is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. Dimension " $B$ " does not include dambar protrusion. Allowable dambar protrusion shall be 0.10 mm ( 0.004 inch ) total in excess of " B " dimension at maximum material condition.
10. Controlling dimension: INCHES. Converted millimeter dimensions are not necessarily exact.
