

- **High-Performance Fixed-Point Digital Signal Processor (DSP) – TMS320C6205**
 - 5-ns Instruction Cycle Time
 - 200-MHz Clock Rate
 - Eight 32-Bit Instructions/Cycle
 - 1600 MIPS
- **VelociTI™ Advanced-Very-Long-Instruction-Word (VLIW) TMS320C62x™ DSP Core**
 - Eight Highly Independent Functional Units:
 - Six ALUs (32-/40-Bit)
 - Two 16-Bit Multipliers (32-Bit Result)
 - Load-Store Architecture With 32 32-Bit General-Purpose Registers
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
- **Instruction Set Features**
 - Byte-Addressable (8-, 16-, 32-Bit Data)
 - 8-Bit Overflow Protection
 - Saturation
 - Bit-Field Extract, Set, Clear
 - Bit-Counting
 - Normalization
- **1M-Bit On-Chip SRAM**
 - 512K-Bit Internal Program/Cache (16K 32-Bit Instructions)
 - 512K-Bit Dual-Access Internal Data (64K Bytes)
 - Organized as Two 32K-Byte Blocks for Improved Concurrency
- **32-Bit External Memory Interface (EMIF)**
 - Glueless Interface to Synchronous Memories: SDRAM or SBSRAM
 - Glueless Interface to Asynchronous Memories: SRAM and EPROM
 - 52M-Byte Addressable External Memory Space
- **Four-Channel Bootloading Direct-Memory-Access (DMA) Controller With an Auxiliary Channel**
- **Flexible Phase-Locked-Loop (PLL) Clock Generator**
- **32-Bit/33-MHz Peripheral Component Interconnect (PCI) Master/Slave Interface**

Conforms to:

 - PCI Specification 2.2
 - Power Management Interface 1.1

Meets Requirements of PC99

 - PCI Access to All On-Chip RAM, Peripherals, and External Memory (via EMIF)
 - Four 8-Deep x 32-Wide FIFOs for Efficient PCI Bus Data Transfer
 - 3.3/5-V PCI Operation
 - Three PCI Bus Address Registers:
 - Prefetchable Memory
 - Non-Prefetchable Memory I/O
 - Supports 4-Wire Serial EEPROM Interface
 - PCI Interrupt Request Under DSP Program Control
 - DSP Interrupt Via PCI I/O Cycle
- **Two Multichannel Buffered Serial Ports (McBSPs)**
 - Direct Interface to T1/E1, MVIP, SCSA Framers
 - ST-Bus-Switching Compatible
 - Up to 256 Channels Each
 - AC97-Compatible
 - Serial-Peripheral-Interface (SPI) Compatible (Motorola™)
- **Two 32-Bit General-Purpose Timers**
- **IEEE-1149.1 (JTAG†) Boundary-Scan-Compatible**
- **288-Pin MicroStar BGA™ Package (GHK and ZHK Suffixes)**
- **0.15-μm/5-Level Metal Process**
 - CMOS Technology
- **3.3-V I/Os, 1.5-V Internal, 5-V Voltage Tolerance for PCI I/O Pins**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

REVISION HISTORY

This data sheet revision history highlights the technical changes made to the SPR106E device-specific data sheet to make it an SPRS106F revision. It also highlights technical changes made to SPRS219F to generate SPRS219G . These changes are marked by **[Revision G]** in the Revision History below.

Scope: Applicable updates to the C62x device family, specifically relating to the C6205 device, have been incorporated.

PAGE(S) NO.	ADDITIONS/CHANGES/DELETIONS
	Added information for the ZHK Mechanical Package [Revision G] Moved Revision History to front of document [Revision G]

description

The TMS320C62x™ DSPs (including the TMS320C6205 device) compose the fixed-point DSP generation in the TMS320C6000™ DSP platform. The TMS320C6205 (C6205) device is based on the high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making the C6205 an excellent choice for multichannel and multifunction applications.

With performance of up to 1600 million instructions per second (MIPS) at a clock rate of 200 MHz, the C6205 offers cost-effective solutions to high-performance DSP-programming challenges. The C6205 DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide six arithmetic logic units (ALUs) for a high degree of parallelism and two 16-bit multipliers for a 32-bit result. The C6205 can produce two multiply-accumulates (MACs) per cycle for a total of 400 million MACs per second (MMACS). The C6205 DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals.

The C6205 includes a large bank of on-chip memory and has a powerful and diverse set of peripherals. Program memory consists of a 64K-byte block that is user-configurable as cache or memory-mapped program space. Data memory consists of two 32K-byte blocks of RAM. The peripheral set includes two multichannel buffered serial ports (McBSPs), two general-purpose timers, a peripheral component interconnect (PCI) module that supports 33-MHz master/slave interface and 4-wire serial EEPROM interface, and a glueless external memory interface (EMIF) capable of interfacing to SDRAM or SDRAM and asynchronous peripherals.

The C6205 has a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

functional and CPU (DSP core) block diagram

TMS320C6205

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106G – OCTOBER 1999 – REVISED JULY 2006

CPU (DSP core) description

The CPU fetches VelociTI™ advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI™ VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C62x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU [see the Functional and CPU (DSP Core) Block Diagram and Figure 1]. The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

Another key feature of the C62x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C62x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically “true”). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the 256-bit wide fetch-packet boundary, the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

memory map summary

Table 2 shows the memory map address ranges of the C6205 device. The C6205 device has the capability of a MAP 0 or MAP 1 memory block configuration. The maps differ in that MAP 0 has *external memory* mapped at address 0x0000 0000 and MAP 1 has *internal memory* mapped at address 0x0000 0000. These memory block configurations are set up at reset by the boot configuration pins (generically called BOOTMODE[4:0]). For the C6205 device, the BOOTMODE configuration is handled, at reset, by the expansion bus module (specifically XD[4:0] pins). For more detailed information on the C6205 device settings, which include the device boot mode configuration at reset and other device-specific configurations, see *TMS320C620x/C670x DSP Boot Modes and Configuration* (literature number SPRU642).

Signal Descriptions

SIGNAL NAME	NO.	TYPE†	DESCRIPTION
CLOCK/PLL			
CLKIN	J3	I	Clock Input
CLKOUT2	T19	O	Clock output at half of device speed •Used for synchronous memory interface
CLKMODE0	L3	I	Clock mode select 0 •Selects whether the on-chip PLL is used or bypassed. For more details, see the <i>Clock PLL</i> section. •The PLL Multiply Factor is selected at boot configuration. For more details, see the EMIF – Data pin descriptions and the clock PLL section.
PLL _V ‡	K5	A§	PLL analog V _{CC} connection for the low-pass filter
PLL _G ‡	L2	A§	PLL analog GND connection for the low-pass filter
PLL _F ‡	L1	A§	PLL low-pass filter connection to external components and a bypass capacitor
JTAG EMULATION			
TMS	E17	I	JTAG test-port mode select (features an internal pullup)
TDO	D19	O/Z	JTAG test-port data out
TDI	D18	I	JTAG test-port data in (features an internal pullup)
TCK	D17	I	JTAG test-port clock
TRST	C19	I	JTAG test-port reset (features an internal pulldown)
EMU1	E18	I/O/Z	Emulation pin 1, pullup with a dedicated 20-kΩ resistor¶
EMU0	F15	I/O/Z	Emulation pin 0, pullup with a dedicated 20-kΩ resistor¶
RESET AND INTERRUPTS			
RESET	C3	I	Device reset
NMI	A8	I	Nonmaskable interrupt •Edge-driven (rising edge)
EXT_INT7	B15	I	External interrupts •Edge-driven •Polarity independently selected via the External Interrupt Polarity Register bits (EXTPOL.[3:0])
EXT_INT6	C15		
EXT_INT5	A16		
EXT_INT4	B16		
IACK	A15	O	Interrupt acknowledge for all active interrupts serviced by the CPU
INUM3	F12	O	Active interrupt identification number •Valid during IACK for all active interrupts (not just external) •Encoding order follows the interrupt-service fetch-packet ordering
INUM2	A14		
INUM1	B14		
INUM0	C14		
POWER-DOWN STATUS			
PD	B18	O	Power-down modes 2 or 3 (active if high)

† I = Input, O = Output, Z = High Impedance, S = Supply Voltage, GND = Ground

‡ PLLV, PLLG, and PLLF are not part of external voltage supply or ground. See the *clock PLL* section for information on how to connect these pins.

§ A = Analog Signal (PLL Filter)

¶ For emulation and normal operation, pull up EMU1 and EMU0 with a dedicated 20-kΩ resistor. For boundary scan, pull down EMU1 and EMU0 with a dedicated 20-kΩ resistor.

development support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE) including Editor
C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP BIOS), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)
EVM (Evaluation Module)

The *TMS320 DSP Development Support Reference Guide* (SPRU011) contains information about development-support products for all TMS320™ DSP family member devices, including documentation. See this document for further information on TMS320™ DSP documentation or any TMS320™ DSP support products from Texas Instruments. An additional document, the *TMS320 Third-Party Support Reference Guide* (SPRU052), contains information about TMS320™ DSP-related products from other companies in the industry. To receive TMS320™ DSP literature, contact the Literature Response Center at 800/477-8924.

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL) and select "Find Development Tools". For device-specific tools, under "Semiconductor Products" select "Digital Signal Processors", choose a product family, and select the particular DSP device. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

TMS320C6205 FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106G – OCTOBER 1999 – REVISED JULY 2006

device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (i.e., **TMS320C6205GHK200**). Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX	Experimental device that is not necessarily representative of the final device's electrical specifications
TMP	Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
TMS	Fully qualified production device

Support tool development evolutionary flow:

TMDX	Development-support product that has not yet completed Texas Instruments internal qualification testing.
TMDS	Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

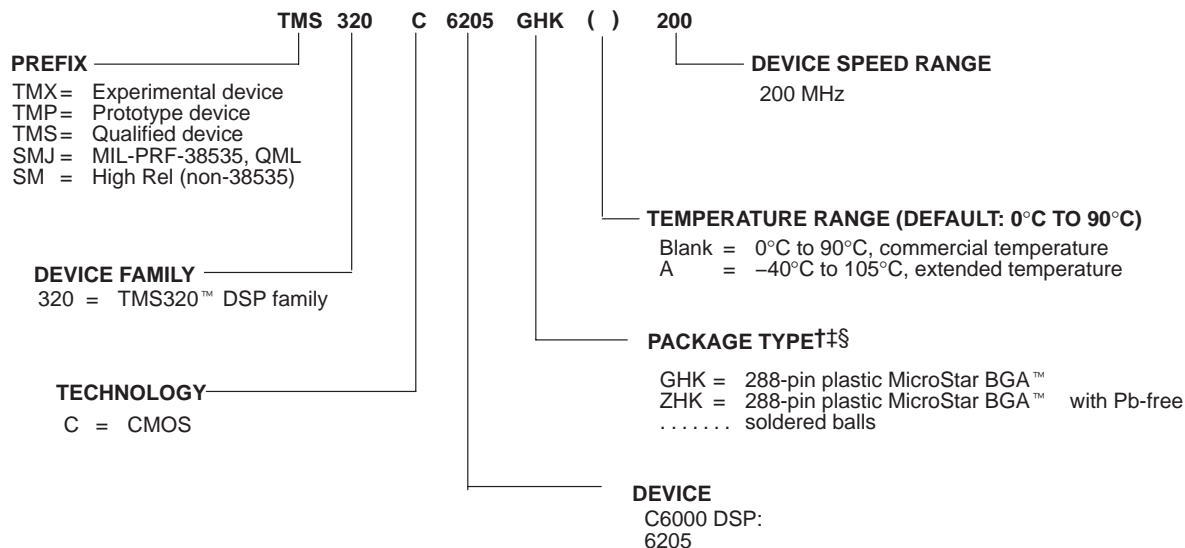

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GHK), the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz (for example, -200 is 200 MHz).

The ZHK package, like the GHK package, is a 288-ball plastic BGA *only* with Pb-free balls. For device part numbers and further ordering information for TMS320C6205 in the GHK and ZHK package types, see the TI website (<http://www.ti.com>) or contact your TI sales representative.

device and development-support tool nomenclature (continued)

‡

† BGA = Ball Grid Array

‡ For actual device part numbers (P/Ns) and ordering information, see the Mechanical Data section of this document or the TI website (www.ti.com).

§ The ZHK mechanical package designator represents the version of the GHK with Pb-Free soldered balls.

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106G – OCTOBER 1999 – REVISED JULY 2006

documentation support

Extensive documentation supports all TMS320™ DSP family devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ DSP core (CPU) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) briefly describes the functionality of the peripherals available on the C6000™ DSP platform of devices, such as the 64-/32-/16-bit external memory interfaces (EMIFs), 32-/16-bit host-port interfaces (HPIs), multichannel buffered serial ports (McBSPs), direct memory access (DMA), enhanced direct-memory-access (EDMA) controller, expansion bus (XB), peripheral component interconnect (PCI), clocking and phase-locked loop (PLL); and power-down modes.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the C62x™/C67x™ devices, associated development tools, and third-party support.

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of the latest C6000™ DSP documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

See the Worldwide Web URL for the new *How to Begin Development with the TMS320C6205 DSP* application report (literature number SPRA596) which describes the functionalities unique to the C6205 device, especially the peripheral component interconnect (PCI) module interface.

C62x and C67x are trademarks of Texas Instruments.

clock PLL

Most of the internal C6205 clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock in frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 5, Table 3, and Table 4 show the external PLL circuitry for either x1 (PLL bypass) or x4 PLL multiply modes. Figure 6 shows the external PLL circuitry for a system with ONLY x1 (PLL bypass) mode.

To minimize the clock jitter, a single clean power supply should power both the C6205 device and the external clock oscillator circuit. Noise coupling into PLLF directly impacts PLL clock jitter. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section.

- NOTES:
- A. Keep the lead length and the number of vias between pin PLLF, pin PLLG, R1, C1, and C2 to a minimum. In addition, place all PLL components (R1, C1, C2, C3, C4, and EMI Filter) as close to the C6000™ DSP device as possible. Best performance is achieved with the PLL components on a single side of the board without jumpers, switches, or components other than the ones shown.
 - B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (R1, C1, C2, C3, C4, and the EMI Filter).
 - C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD} .
 - D. EMI filter manufacturer: TDK part number ACF451832-333, 223, 153, 103. Panasonic part number EXCET103U.
 - E. At power up, the PLL requires a falling edge of RESET to initialize the PLL engine. It may be necessary to toggle reset in order to establish proper PLL operation.

Figure 5. External PLL Circuitry for Either PLL Multiply Modes or x1 (Bypass) Mode

- NOTES:
- A. For a system with ONLY PLL x1 (bypass) mode, short the PLLF to PLLG.
 - B. The 3.3-V supply for PLLV must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD} .

Figure 6. External PLL Circuitry for x1 (Bypass) PLL Mode Only

SPRS106G – OCTOBER 1999 – REVISED JULY 2006

clock PLL (continued)

Table 3. C6205 PLL Multiply Modes and x1 (Bypass) Options

CLKMODE0†	ED[31]‡	ED[27]‡	ED[23]‡	PLL MULTIPLY FACTORS	CPU CLOCK FREQ f(CPU clock)
0	X	X	X	x1 (Bypass)	$1 \times f(\text{CLKIN})$
1	0	0	0	x1 (Bypass)	$1 \times f(\text{CLKIN})$
1	0	0	1	x4	$4 \times f(\text{CLKIN})$
1	0	1	0	x8	$8 \times f(\text{CLKIN})$
1	0	1	1	x10	$10 \times f(\text{CLKIN})$
1	1	0	0	x6	$6 \times f(\text{CLKIN})$
1	1	0	1	x9	$9 \times f(\text{CLKIN})$
1	1	1	0	x7	$7 \times f(\text{CLKIN})$
1	1	1	1	x11	$11 \times f(\text{CLKIN})$

† CLKMODE0 equal to 0 denotes on-chip PLL bypassed

CLKMODE0 equal to 1 denotes on-chip PLL used, except when configuration bits (ED[31], ED[27], and ED[23]) are 0 at device reset.

‡ ED[31], ED[27], and ED[23] are the on-chip PLL configuration bits that are latched during device reset, along with the other boot configuration bits ED[31:0].

Table 4. C6205 PLL Component Selection Table§

CLKMODE	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY (CLKOUT1) RANGE (MHz)	CLKOUT2 RANGE (MHz)	R1 [$\pm 1\%$] (Ω)	C1 [$\pm 10\%$] (nF)	C2 [$\pm 10\%$] (pF)	TYPICAL LOCK TIME (μ s)
x4	32.5–50	130–200	65–100	60.4	27	560	75
x6	21.7–33.3						
x7	18.6–28.6						
x8	16.3–25						
x9	14.4–22.2						
x10	13–20						
x11	11.8–18.2						

§ Under some operating conditions, the maximum PLL lock time may vary as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μ s, the maximum value may be as long as 250 μ s.

Figure 7 shows the power-down mode logic on the C6205.

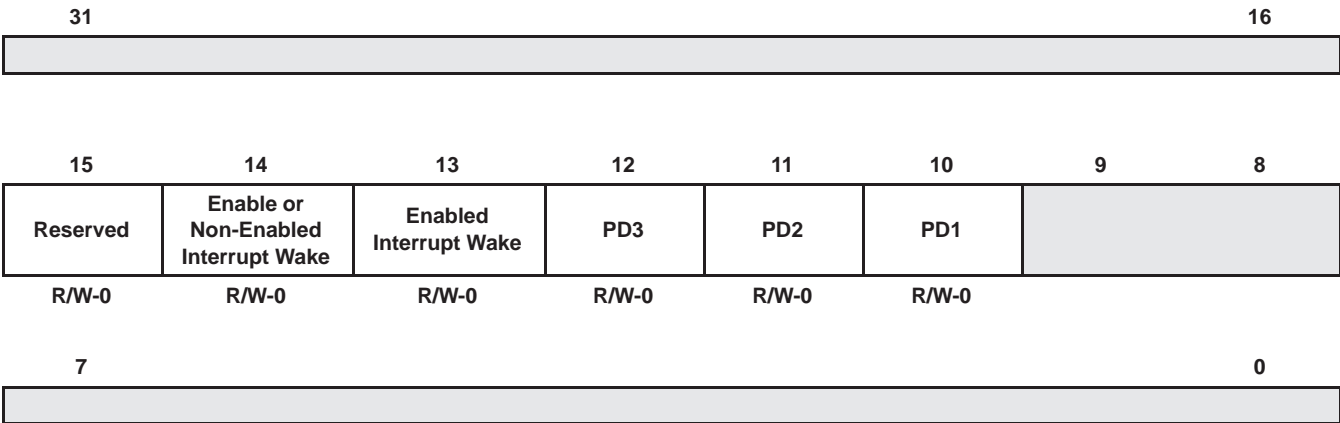

TMS320C6205
FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106G – OCTOBER 1999 – REVISED JULY 2006

triggering, wake-up, and effects

The power-down modes and their wake-up methods are programmed by setting the PWRD field (bits 15–10) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 8 and described in Table 5. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when “writing” to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Legend: R/W–x = Read/write reset value
NOTE: The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Figure 8. PWRD Field of the CSR Register

Power-down mode PD1 takes effect eight to nine clock cycles after the instruction that sets the PWRD bits in the CSR.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. The GIE bit in CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 5 summarizes all the power-down modes.

Table 5. Characteristics of the Power-Down Modes

PRWD FIELD (BITS 15–10)	POWER-DOWN MODE	WAKE-UP METHOD	EFFECT ON CHIP'S OPERATION
000000	No power-down	—	—
001001	PD1	Wake by an enabled interrupt	CPU halted (except for the interrupt logic) Power-down mode blocks the internal clock inputs at the boundary of the CPU, preventing most of the CPU's logic from switching. During PD1, DMA transactions can proceed between peripherals and internal memory.
010001	PD1	Wake by an enabled or non-enabled interrupt	
011010	PD2 [†]	Wake by a device reset	Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off.
011100	PD3 [†]	Wake by a device reset	Input clock to the PLL stops generating clocks. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked.
All others	Reserved	—	—

[†] When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

TMS320C6205

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106G – OCTOBER 1999 – REVISED JULY 2006

power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time if the other supply is below the proper operating voltage.

system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, the core supply should be powered up at the same time as, or prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

power-supply design considerations

For systems using the C6000™ DSP platform of devices, the core supply may be required to provide in excess of 2 A per DSP until the I/O supply is powered up. This extra current condition is a result of uninitialized logic within the DSP(s) and is corrected once the CPU sees an internal clock pulse. With the PLL enabled, as the I/O supply is powered on, a clock pulse is produced stopping the extra current draw from the supply. With the PLL disabled, as many as five external clock cycle pulses may be required to stop this extra current draw. A normal current state returns once the I/O power supply is turned on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power up and the I/O supply power up can minimize the effects of this current draw.

A dual-power supply with simultaneous sequencing, such as that available with TPS563xx controllers or PT69xx plug-in power modules, can be used to eliminate the delay between core and I/O power up [see the *Using the TPS56300 to Power DSPs* application report (literature number SLVA088)]. A Schottky diode can also be used to tie the core rail to the I/O rail, effectively pulling up the I/O power supply to a level that can help initialize the logic within the DSP.

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

absolute maximum ratings over operating case temperature range (unless otherwise noted)[†]

Supply voltage ranges:	CV _{DD} (see Note 1)	– 0.3 V to 2.3 V
	DV _{DD} (see Note 1)	–0.3 V to 4 V
	(PCI), V _{IOP} (see Note 1)	–0.5 V to 5.5 V
	(PCI), V _{DDP} (see Note 1)	–0.3 V to 4 V
Input voltage ranges:	(except PCI), V _I	–0.3 V to 4 V
	(PCI), V _{IP}	–0.5 V to V _{IOP} + 0.5 V
Output voltage ranges:	(except PCI), V _O	–0.3 V to 4 V
	(PCI), V _{OP}	–0.5 V to V _{IOP} + 0.5 V
Operating case temperature range, T _C		0°C to 90°C
Storage temperature range, T _{stg}		–65°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to V_{SS}.

4	t _t (CLKIN) Transition time, CLKIN	5		0.6		ns

† The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.

‡ M = the PLL multiplier factor (x4, x6, x7, x8, x9, x10, or x11). For more details, see the clock PLL section of this data sheet.

§ C = CLKIN cycle time in ns. For example, when CLKIN frequency is 50 MHz, use C = 20 ns.

Figure 12. CLKIN Timings

timing requirements for PCLKIN† (see Figure 13)

NO.		–200		UNIT
		MIN	MAX	
1	$t_c(\text{PCLK})$ Cycle time, PCLK	30		ns
2	$t_w(\text{PCLKH})$ Pulse duration, PCLK high	11		ns
3	$t_w(\text{PCLKL})$ Pulse duration, PCLK low	11		ns
4	$t_{sr}(\text{PCLK})$ $\Delta v/\Delta t$ slew rate, PCLK	1	4	V/ns

† When the 5-V PCI clamp is used, the reference points for the rise and fall transitions are measured V_{ILP} MAX and V_{IHP} MIN for 5 V operation. When the 3.3-V PCI clamp is used, the reference points for the rise and fall transitions are measured at V_{ILP} MAX and V_{IHP} MIN for 3.3 V operation.

Figure 13. PCLK Timings

INPUT AND OUTPUT CLOCKS (CONTINUED)

switching characteristics over recommended operating conditions for CLKOUT2^{†‡} (see Figure 14)

NO.	PARAMETER	–200		UNIT
		MIN	MAX

SPRS106G – OCTOBER 1999 – REVISED JULY 2006

ASYNCHRONOUS MEMORY TIMING

timing requirements for asynchronous memory cycles^{†‡§¶} (see Figure 15 – Figure 18)

NO.			–200		UNIT
			MIN	MAX	
3	$t_{su}(EDV-AREH)$	Setup time, EDx valid before \overline{ARE} high	1.5		ns
4	$t_h(AREH-EDV)$	Hold time, EDx valid after \overline{ARE} high	3.5		ns
6	$t_{su}(ARDYH-AREL)$	Setup time, ARDY high before \overline{ARE} low	$-[(RST - 3) * P - 6]$		ns
7	$t_h(AREL-ARDYH)$	Hold time, ARDY high after \overline{ARE} low	$(RST - 3) * P + 3$		ns
9	$t_{su}(ARDYL-AREL)$	Setup time, ARDY low before \overline{ARE} low	$-[(RST - 3) * P - 6]$		ns
10	$t_h(AREL-ARDYL)$	Hold time, ARDY low after \overline{ARE} low	$(RST - 3) * P + 3$		ns
11	$t_w(ARDYH)$	Pulse width, ARDY high	2P		ns
15	$t_{su}(ARDYH-AWEL)$	Setup time, ARDY high before \overline{AWE} low	$-[(WST - 3) * P - 6]$		ns
16	$t_h(AWEL-ARDYH)$	Hold time, ARDY high after \overline{AWE} low	$(WST - 3) * P + 3$		ns
18	$t_{su}(ARDYL-AWEL)$	Setup time, ARDY low before \overline{AWE} low	$-[(WST - 3) * P - 6]$		ns
19	$t_h(AWEL-ARDYL)$	Hold time, ARDY low after \overline{AWE} low	$(WST - 3) * P + 3$		ns

[†] To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. If ARDY does meet setup or hold time, it may be recognized in the current cycle or the next cycle. Thus, ARDY can be an asynchronous input.

[‡] RS = Read Setup, RST = Read Strobe, RH = Read Hold, WS = Write Setup, WST = Write Strobe, WH = Write Hold. These parameters are programmed via the EMIF CE space control registers.

[§] P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

[¶] The sum of RS and RST (or WS and WST) must be a minimum of 4 in order to use ARDY input to extend strobe width.

switching characteristics over recommended operating conditions for asynchronous memory cycles^{†§¶} (see Figure 15 – Figure 18)

Figure 25. SDRAM REFR Command

† $\overline{\text{SDCAS}}/\overline{\text{SSADS}}$, $\overline{\text{SDRAS}}/\overline{\text{SSOE}}$, and $\overline{\text{SDWE}}/\overline{\text{SSWE}}$ operate as $\overline{\text{SDCAS}}$, $\overline{\text{SDRAS}}$, and $\overline{\text{SDWE}}$, respectively, during SDRAM accesses.

Figure 26. SDRAM MRS Command

HOLD/HOLDA TIMING

timing requirements for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles[†] (see Figure 27)

NO.		–200		UNIT
		MIN	MAX	
3	$t_{oh}(\overline{\text{HOLDAL}}-\overline{\text{HOLDL}})$ Output hold time, $\overline{\text{HOLD}}$ low after $\overline{\text{HOLDA}}$ low	P		ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

switching characteristics over recommended operating conditions for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles^{†‡} (see Figure 27)

NO.	PARAMETER		–200		UNIT
			MIN	MAX	
1	$t_d(\overline{\text{HOLDL}}-\text{EMHZ})$	Delay time, $\overline{\text{HOLD}}$ low to EMIF Bus high impedance	4P	§	ns
2	$t_d(\text{EMHZ}-\overline{\text{HOLDAL}})$	Delay time, EMIF Bus high impedance to $\overline{\text{HOLDA}}$ low	0	2P	ns
4	$t_d(\overline{\text{HOLDH}}-\text{EMLZ})$	Delay time, $\overline{\text{HOLD}}$ high to EMIF Bus low impedance	3P	7P	ns
5	$t_d(\text{EMLZ}-\overline{\text{HOLDAH}})$	Delay time, EMIF Bus low impedance to $\overline{\text{HOLDA}}$ high	0	2P	ns

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

[‡] EMIF Bus consists of $\overline{\text{CE}}[3:0]$, $\overline{\text{BE}}[3:0]$, $\overline{\text{ED}}[31:0]$, $\overline{\text{EA}}[21:2]$, $\overline{\text{ARE}}$, $\overline{\text{AOE}}$, $\overline{\text{AWE}}$, $\overline{\text{SDCAS}}/\overline{\text{SSADS}}$, $\overline{\text{SDRAS}}/\overline{\text{SSOE}}$, $\overline{\text{SDWE}}/\overline{\text{SSWE}}$, and $\overline{\text{SDA10}}$.

§ All pending EMIF transactions are allowed to complete before $\overline{\text{HOLDA}}$ is asserted. The worst case for this is an asynchronous read or write with external ARDY used or a minimum of eight consecutive SDRAM reads or writes when RBTR8 = 1. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting NOHOLD = 1.

[†] EMIF Bus consists of $\overline{\text{CE}}[3:0]$, $\overline{\text{BE}}[3:0]$, $\overline{\text{ED}}[31:0]$, $\overline{\text{EA}}[21:2]$, $\overline{\text{ARE}}$, $\overline{\text{AOE}}$, $\overline{\text{AWE}}$, $\overline{\text{SDCAS}}/\overline{\text{SSADS}}$, $\overline{\text{SDRAS}}/\overline{\text{SSOE}}$, $\overline{\text{SDWE}}/\overline{\text{SSWE}}$, and $\overline{\text{SDA10}}$.

Figure 27. $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ Timing

TMS320C6205

FIXED-POINT DIGITAL SIGNAL PROCESSOR

SPRS106G – OCTOBER 1999 – REVISED JULY 2006

RESET TIMING

timing requirements for reset (see Figure 28)

NO.			–200		UNIT
			MIN	MAX	
1	$t_{w(RST)}$	Width of the \overline{RESET} pulse (PLL stable) [†]	10P [‡]		ns
		Width of the \overline{RESET} pulse (PLL needs to sync up) [§]	250		μs
10	$t_{su(ED)}$	Setup time, ED boot configuration bits valid before \overline{RESET} high [¶]	5P [‡] #		ns
11	$t_h(ED)$	Hold time, ED boot configuration bits valid after \overline{RESET} high [¶]	5P [‡]		ns

[†] This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x4, x6, x7, x8, x9, x10, and x11 when CLKIN and PLL are stable.

[‡] P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

[§] This parameter applies to CLKMODE x4, x6, x7, x8, x9, x10, and x11 only. The \overline{RESET} signal is not connected internally to the Clock PLL circuit. The PLL requires a minimum of 250 μs to stabilize following device power up or after PLL configuration has been changed. During that time, \overline{RESET} must be asserted to ensure proper device operation. See the *clock PLL* section for power up (specifically Figure 5, Note E) and for PLL lock times (Table 4).

[¶] ED[31:0] are the boot configuration pins during device reset.

[#] A 250 μs setup time before the rising edge of \overline{RESET} is required when using CLKMODE x4, x6, x7, x8, x9, x10, or x11.

			CLKX ext	3		

† CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

‡ $P = 1/\text{CPU clock frequency in ns}$. For example, when running parts at 200 MHz, use $P = 5$ ns.

§ The maximum bit rate for the C6205 devices is 100 Mbps or CPU/2 (the slower of the two). Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 100 MHz; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time ($2P$), or 10 ns (100 MHz), whichever value is larger. For example, when running parts at 200 MHz ($P = 5$ ns), use 10 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 100 MHz ($P = 10$ ns), use $2P = 20$ ns (50 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode ($R/XDATDLY = 01b$ or $10b$) and the other device the McBSP communicates to is a slave.

¶ The minimum CLKR/X pulse duration is either $(P - 1)$ or 4 ns, whichever is larger. For example, when running parts at 200 MHz ($P = 5$ ns), use 4 ns as the minimum CLKR/X pulse duration. When running parts at 100 MHz ($P = 10$ ns), use $(P - 1) = 9$ ns as the minimum CLKR/X pulse duration.

MULTICHANNEL BUFFERED SERIAL PORT TIMING (CONTINUED)

switching characteristics over recommended operating conditions for McBSP^{†‡} (see Figure 33)

NO.	PARAMETER			–200		UNIT
				MIN	MAX

			CLKX ext	2	12	
14	$t_d(\text{FXH-DXV})$	Delay time, FSX high to DX valid ONLY applies when in data delay 0 (XDATDLY = 00b) mode.	FSX int	–1	5	ns
			FSX ext	2	12	

[†] CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

[‡] Minimum delay times also represent minimum output hold times.

[§] P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

^{\P} The maximum bit rate for the C6205 devices is 100 Mbps or CPU/2 (the slower of the two). Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 100 MHz; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 10 ns (100 MHz), whichever value is larger. For example, when running parts at 200 MHz (P = 5 ns), use 10 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 100 MHz (P = 10 ns), use 2P = 20 ns (50 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

[#] C = H or L

S = sample rate generator input clock = P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)

H = CLKX high pulse width = (CLKGDV/2 + 1) * S if CLKGDV is even

= (CLKGDV + 1)/2 * S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) * S if CLKGDV is even

= (CLKGDV + 1)/2 * S if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the 100-MHz limit.

TMX320C6205GHK	OBSOLETE	BGA MICROSTAR	GHK	288		TBD	Call TI	Call TI	0 to 0		

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC BALL GRID ARRAY

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.

ZHK (S-PBGA-N288)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. This is a lead-free solder ball design.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
